

Add new LLMs and vectorstore destinations via config file matching namespace. Namespace can be derived from channel source, bot name or URL path

```
config:{  
  "namespace1":{  
    "llm":"vertex",  
    "vectorstore": "matching_engine"  
  },  
  "namespace2":{  
    "llm":"openai",  
    "vectorstore": "supabase"  
  },  
}
```

Other sources can also add to bucket directly, namespace taken from the folder\_name
